

Lecture 12

HELSINGIN YLIOPISTO
HELSINGFORS UNIVERSITET
UNIVERSITY OF HELSINKI

Multicore computers Course Summary

Ch 18 [Sta10]

Why Multicore?

- Current trend by processor manufacturers, because older improvements are no longer that promising
 - Clock frequency
 - Pipeline, superscalar,
 - Simultaneous multithreading, SMT (or hyperthreading)
- Enough transistors available on one chip to put two or more whole cores on the chip
 - Symmetric multiprocessor on one chip only
- But ... diminishing returns
 - More complexity requires more logic
 - Increasing chip area for coordinating and signal transfer logic

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 2

Real Problem

- Moore's Law: transistor density doubles every 1.5 years
 - Processor speed doubles also
 - True 1980-2003?
- Heat barrier: can not pack processors so thick
 - No more faster processors
- Now: more processors per chip
 - Multicore CPU
 - Chip-level multiprocessor (CMP)

Heh Sutter, "A Fundamental Turn Toward Concurrency in SW", Dr. Dobbs's Journal, 2005.

What is Multicore?

Sta10 Fig 18.1

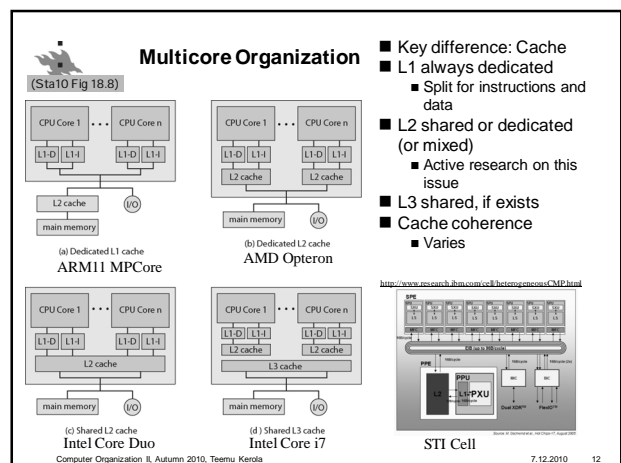

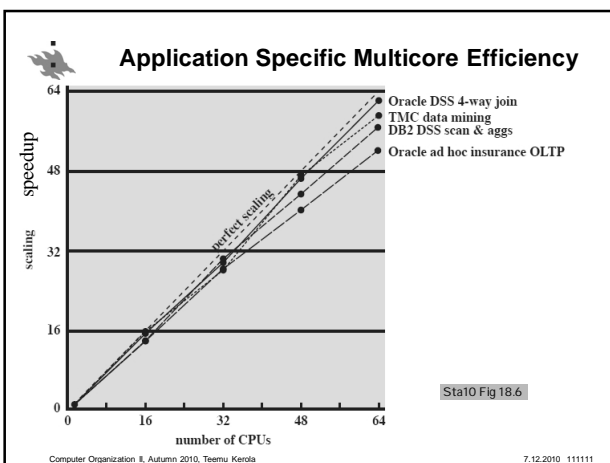

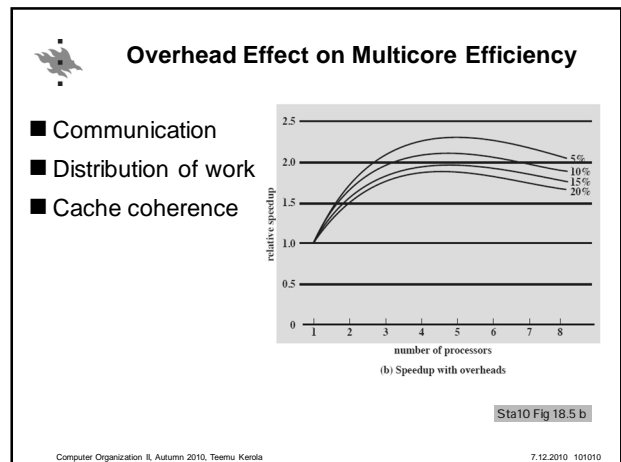

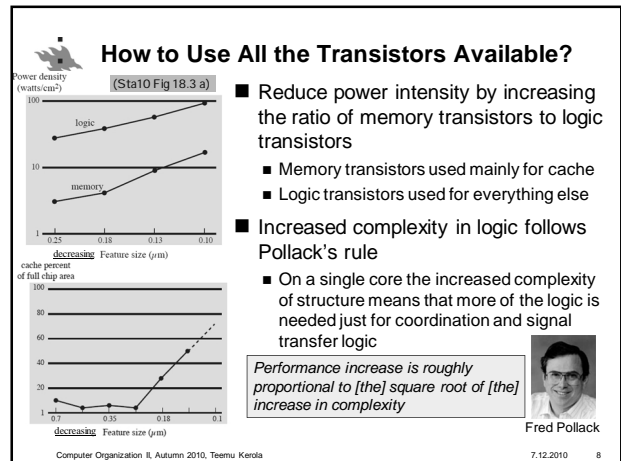

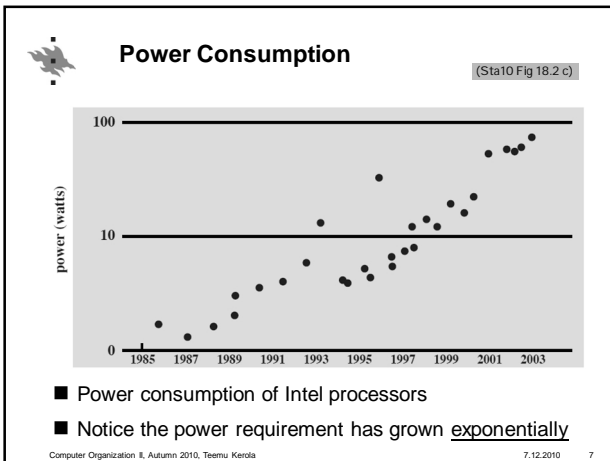

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 555

Performance Gains

(Sta10 Fig 18.2 b)

- Figure shows relative performance in Intel processors
- Dots calculated as a ratio of published SPEC CPU figures divided by clock frequency of that processor
- Late 1980's no parallelism yet – flat curve
- Steep rise of the curve with improvements in instruction-level parallelism
 - pipelines, superscalar, SMT
- Flat again around 2000 -> limit of instruction-level parallelism reached

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 6

Shared L2 Cache vs. Dedicated ones

- Constructive interference
 - One core may fetch a cache line that is soon needed by another code – already available in shared cache
- Single copy
 - Shared data is not replicated, so there is just one copy of it.
- Dynamic allocation
 - The thread that has less locality needs more cache and may occupy more of the cache area
- Shared cache – no cache coherence solution needed
 - The shared data element already in the shared cache. With dedicated caches, the shared data must be invalidated from other caches before using
- Slower access
 - Larger cache area is slower to access, small dedicated cache would be faster

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 13

Computer Organization II

Intel Core Duo and Core i7

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 14

Intel Core Duo, 2006

Sta10 Fig 18.9

- Two x86 superscalar, shared L2 cache
 - MESI support for L1 caches
 - L2 data shared between local cores or external
- Thermal control unit per core
 - Manages chip heat dissipation
 - Maximize performance within constraints
- Advanced Programmable Interrupt Controlled (APIC)
 - Inter-process interrupts between cores
 - Routes interrupts to appropriate core
 - Includes timer so OS can interrupt core
- Power Management Logic
 - Adjusts voltage and power consumption
 - Can switch individual processor logic subsystems on and off

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 15

Intel Core i7 Block Diagram

Sta10 Fig 18.10

- Four x86 SMT processors each with two simultaneous threads
- Dedicated L2, shared L3 cache
- Speculative pre-fetch for caches
- On chip DDR3 memory controller
 - Three 8 byte channels (192 bits) giving 32GB/s
 - No front side bus (mem access through cache)
- QuickPath Interconnection
 - Cache coherent point-to-point link
 - High speed communications between processor chips
 - 6.4G transfers per second, 16 bits per transfer
 - Dedicated bi-directional pairs
 - Total bandwidth 25.6GB/s

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 16

Computer Organization II

ARM11 MPCore

<http://www.arm.com/products/processors/classic/arm11/arm11-mpcore.php>

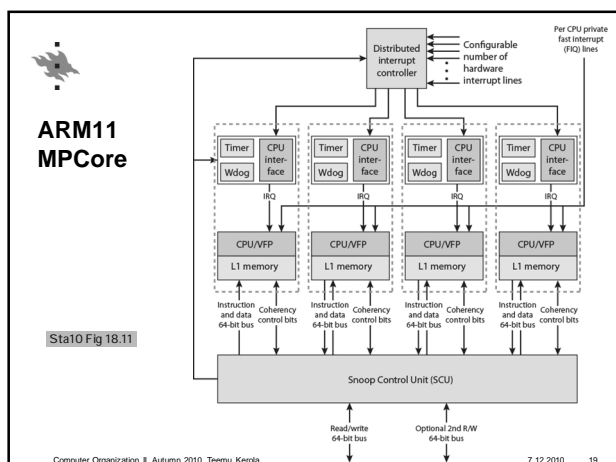

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 17

ARM11 MPCore

- Up to 4 processors per chip
- Distributed interrupt controller
- Timer per CPU
- Watchdog
 - Warning alerts for software failures
 - Counts down from predetermined values, issues warning at zero
- CPU interface
 - Interrupt acknowledgement, masking and completion acknowledgement
- MP11 – Single ARM11 core (CPU)
- Vector floating-point (VFP) co-processor
- Dedicated split snoop L1 cache
- Shared unified L2 cache, off-chip

(a) Dedicated L1 cache Sta10 Fig 18.8

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 18

ARM11 MPCore Interrupt Control

- Distributed Interrupt Controller (DIC)
 - collates interrupts from many sources
 - Masking, prioritization
 - Distribution to target MP11 CPUs
 - Status tracking (Interrupt states: pending, active, inactive)
 - Software interrupt generation
- Number of interrupts independent of MP11 CPU design
- Accessed by CPUs via private interface through SCU
- Can route interrupts to single or multiple CPUs
 - OS can generate interrupts: all-but-self, self, or specific CPU
- Provides inter-process communication (16 intr. ids)
 - Thread on one CPU can cause activity by thread on another CPU

ARM11 MPCore L1 Cache Coherency

- MESI
- Direct Data Intervention (DDI)
 - Copy (clean) cache lines directly between caches
- Duplicated tag RAM (tag fields)
 - Copies of tag RAM in many CPU's
 - Cache knows who has the data needed
- Migratory lines
 - Copy dirty cache lines directly to other caches
 - No need to go to L2 cache, or to memory
 - Modified MESI protocol

Course Summary

|--|--|

Course Exam Tue 14.12.2010 9-12 (A111)

- 2,5 hours – three or four questions
 - Questions are in English
 - You may answer in English, Finnish, or Swedish
- Question try to assess your deeper understanding of relevant topics, not superficial facts
 - More of applying what you have learned
 - Some of understanding relevant concepts
 - Less of rephrasing topics from text book or lectures
 - No details on example architectures
- You can write on all answers on the same paper using pencil or pen
 - No need to write answer to each question to separate sheet
- There is no need for a calculator, but a simple one is allowed
 - If there is math needed, you can just write the formula and you do not need to write the result number without a calculator

For the Exam

- Go through the exercises
 - If you did all homeworks and understand them well, you should do fine in the exam
- Read the book and lecture slides
 - If there is nothing on the slides about the subsection, then there very probably is not a question in the exam
- The review questions in the slides are good hints!
- Old exams are in web
 - Many exams only in Finnish
 - See <https://www.cs.helsinki.fi/courses/581365/2010/s/k/1>
 - "Basic Information" sub-page (tab)
 - "Kerola's CO-II home page", and "Previous Exams" there
 - Exam questions have high temporal locality!

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 25

Digital logic (Ch 20)

- What is the problem and how is it solved?
- Boolean algebra, gates and flip-flops
- Basic ideas on optimization, no Karnaugh maps
- Circuit description with Boolean tables, gates, and graphs
- Flip-flops and basic circuits, basic functionality
 - Understand, how S-R flip-flop works
- Combination circuits vs. sequential circuits
- How to implement memory?
- How to implement functions?
 - How to implement 32-bit add?

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 26

Bus (Ch 3)

- What is the problem and how is it solved?
- Instruction cycle, interrupts
- Bus characteristics
 - Speed, width, asynch/synch timing,
 - Signaling, centralized/distributed arbitration,
 - Events or transactions
- PCI
 - Arbitration, read & write sequences
- Can read and explain timing diagrams

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 27

Cache (Ch 4)

- What is the problem? How is it solved?
- Principle of locality, temporal & spatial locality
- Design features
 - Size, line size, split/unified, levels (L1, L2, L3)
 - Mapping: direct mapping, fully-associative, set-associative
 - Replacement policy
 - Write policy: write-through, write-back, write-once
- Cache coherency problem for multiprocessors

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 28

Main Memory (Ch 5)

- Basic ideas, no details
- DRAM implementation principles
 - Memory address split row and column access select fields
- How to build larger memory from smaller chips

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 29

Memory Management (Ch 8)

- Focus on virtual memory
 - What problem is solved? How is it solved?
 - Solution is based on locality
 - Solve protection problems at the same time?
- Virtual memory organization
 - page table, inverted page table, segment table,
 - hierarchical tables
 - Disk organization to support VM
- Address translation,
 - What is the problem, what is the solution, how is it done?
 - TLB, how does it work, how is it implemented?
- TLB and cache, how do they work together
 - How do you locate referenced data (in cache or in memory)

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 30

Computer Arithmetic (Ch 9)

- What is the problem and how is it solved?
- Integers
 - Representation
 - Add & subtract, multiply, divide
 - Booth's algorithm for multiplication
- Floating-point
 - IEEE representation, unnormalized, NaN, ∞
 - Principles of add, sub, mul, div – overflows/underflows
 - Accuracy
 - In representation
 - In computation
 - Loss of accuracy in certain math ops

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 31

Instruction Sets (Ch 10, 11)

- What is the problem and how is it solved?
- Characteristics
 - Data types, register sets
 - Addressing modes
- Architecture types
 - Accumulator, stack, register, load-store
- Instruction formats
 - Pentium cisc vs. Arm risc
 - Can explain basic differences
 - No need to study details

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 32

CPU Structure and Function (Ch 12)

- What is the problem and how is it solved?
- Structural elements: regs, internal regs, pws
- Pipelined implementation of fetch-exec cycle
 - What is the problem and how is it solved?
 - Performance gains: when and how much?
 - Hazards & dependencies
 - Types: structural, control, data
 - Solution methods: bubbles, compiler, more HW
 - How to solve RAW data dependency problems?
 - Bubble (hw), NOP (sw bubble), instr order (sw), by-pass circuits (hw)
 - How to solve control dependencies?
 - Clear pipeline (hw), delay slots (sw), mult. conditional instr. streams
 - Prefetch target, loop buffer
 - Static and dynamic branch prediction, branch history table

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 33

RISC (Ch 13)

- What is the problem and how is it solved?
- What is CISC, what is RISC?
 - RISC vs CISC
- RISC features
 - Lots of regs, few data types,
 - Few operands and memory addressing types
 - Simple instructions optimized for pipeline
 - Load/Store architecture
- Register files
 - What is the problem and how is it solved?
 - Registers windows, register optimization
- Register allocation problem
 - What is the problem and how is it solved (graph coloring)?

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 34

Superscalar (Ch 14)

- What is the problem and how is it solved?
- Implementation strategies
 - In-order or out-of-order issue
 - In-order or out-of-order complete
 - Instruction selection window, window of execution
- Name dependencies
 - What is the problem and how is it solved?
 - New dependency types to worry about: WAR, RAW
 - Register renaming
- Hyperthreading or multithreading
 - What is the problem and how is it solved?
 - Use larger register set to better utilize pipelines

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 35

Control-Unit (Ch 15, 16)

- What is the problem and how is it solved?
- Micro-ops
 - Micro-op sequences in different phases of the execution cycle
- How control signals make things happen?
 - Control signal state machine
- Hardwired control
 - Direct implementation of control state machine
 - Requires lots of optimization to reduce state space
- Microprogrammed control
 - Structure: control memory, control address, control buffer
 - Horizontal or vertical (functional & resource encoding)
 - Sequencing, i.e., which microinstruction next?

Computer Organization II, Autumn 2010, Teemu Kerola

7.12.2010 36

Parallel Processing (Ch 17)

- What is the problem and how is it solved?
- Classification, SIMD, SMP, etc
- Cache coherency
 - Snoopy-cache
 - MESI
- Clusters
 - NUMA, CC-NUMA
- Vector computation

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 37

Multicore (Ch 18)

- What is the problem and how is it solved?
- Multicore vs. SMP
- Different multicore organizations
- Multicore with CC-NUMA

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 38

-- The End --

STI Cell Power processor element
(a) major units and
(b) pipeline

Computer Organization II, Autumn 2010, Teemu Kerola 7.12.2010 39
