1

Boolean Algebra

- Other operations

- NAND

$$A \text{ NAND } B = \text{NOT}(A \text{ AND } B) = \overline{AB}$$

- NOR

$$A \text{ NOR } B = \text{NOT}(A \text{ OR } B) = A + \overline{B}$$

- Truth tables

- What is the result
of the operation?

		Q
P	AND	0 1
		0 0 0
		1 0 1

Table A.1

4

Boolean Algebra

- George Boole
 - ideas 1854
- Claude Shannon,
 - apply to circuit design, 1938 (piirisuunnitelu)
- Describe digital circuitry function
 - programming language?
- Optimise given circuitry
 - use algebra (Boolean algebra) to manipulate (Boolean) expressions into simpler expressions

17/09/2001

Copyright Teemu Kerola 2001

2

Postulates, Identities in Boolean Algebra

- How can I manipulate expressions?
 - Simple set of rules?
- Basic identities
 - commutative laws (vaihdantalait)
 - distributive laws (osittelulait)
 - identity elements (identiteetit)
 - inverse elements (vasta-alkiot)
 - associative laws (liitääntälait)
 - DeMorgan's theorem (DeMorganin laki)

17/09/2001

Copyright Teemu Kerola 2001

5

Boolean Algebra

- Variables: A, B, C
- Values: TRUE (1), FALSE (0)
- Basic logical operations:
 - binary: AND (\bullet), OR (+) $A \bullet B = AB$ $B + C$
 - unary: NOT ($\bar{}$) \bar{A} (ja, tai, ei)
- Composite operations, equations
 - precedence: NOT, AND, OR
 - parenthesis $D = A + \bar{B} \bullet C = A + ((\bar{B})C)$

17/09/2001

Copyright Teemu Kerola 2001

3

Gates

(portit)

- Fundamental building blocks
 - easy to build [http://tech-www.informatik.uni-hamburg.de/
applets/cmos/cmisdemo.html](http://tech-www.informatik.uni-hamburg.de/applets/cmos/cmisdemo.html)
 - implement basic Boolean algebra operations
- Combine to build more complex circuits
 - memory, adder, multiplier (yhteenlaskupiiri,
kertolaskupiiri)
- 1-3 inputs, 1 output  AND
- Gate delay (viive)
 - change inputs, new output available after gate delay
1 ns? 10 ns?

17/09/2001

Copyright Teemu Kerola 2001

6

Functionally Complete Set

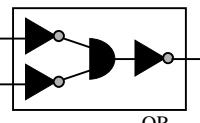

- Can build all basic gates (“and”, “or”, “not”) from a smaller set of gates

– With “and”, “or”, “not” (trivial!)

– With “and”, “not”

• “or”?

$$A + B = \overline{A} \bullet \overline{B}$$

OR

– With “or”, “not”

– With “nand” alone

Fig A.2

– With “nor”

Fig A.3

17/09/2001

7

Algebraic Simplification

- Circuits become too large to handle?

- Use basic identities to simplify Boolean expressions

$$\begin{aligned} F &= \overline{ABC} + \overline{ABC} + ABC\overline{C} \\ &= \overline{AB} + B\overline{C} = B(\overline{A} + \overline{C}) \end{aligned}$$

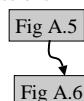

Fig A.6

- May be difficult to do

- How to do it automatically?

- Build a program to do it “best”?

$$\begin{aligned} f &= \overline{abcd} + \overline{abcd} + \overline{abcd} + ab\overline{cd} \\ &\quad + ab\overline{cd} + ab\overline{cd} + ab\overline{cd} + ab\overline{cd} \end{aligned}$$

17/09/2001

Copyright Teemu Kerola 2001

10

Combinational Circuits ⁽³⁾

(yhdistelmä-piirit)

- Interconnected set of gates
 - change input, wait for gate delays, new output
- Output is Boolean function of input signals
 - m (binary, Boolean) inputs
 - n (binary, Boolean) outputs
- Described in three ways
 - describe function with Boolean equations (one for each output) $F = \overline{ABC} + \overline{ABC} + ABC$
 - describe function with truth table [Table A.3](#)
 - describe implementation with graphical symbols for gates and wires [Fig A.4](#)

17/09/2001

Copyright Teemu Kerola 2001

8

Karnaugh Map Squares

- Each square represents complete input value combination

- canonical form: each term has each variable once
- adjacent squares differ only in one input value (wrap around)

order!!

CD:	00	01	11	10	
AB	00	0000	0001	0011	0010
00	0100	0101	0111	0110	
01	1100	1101	1111	1110	
11	1000	1001	1011	1010	
10					

Square for input value combination
 $\overline{ABCD} = 1001$

17/09/2001

Copyright Teemu Kerola 2001

11

Simplify Presentation (and Implementation) ⁽³⁾

- Boolean equations

- Sum of products form (SOP)

$$F = \overline{ABC} + \overline{ABC} + ABC$$

Fig A.4

- Product of sums form (POS)

$$\begin{aligned} F &= (A + B + C) \bullet (A + B + \overline{C}) \bullet (\overline{A} + B + C) \\ &\quad \bullet (\overline{A} + B + \overline{C}) \bullet (\overline{A} + \overline{B} + \overline{C}) \end{aligned}$$

Fig A.5

Which presentation is better?

Fewer gates? Smaller area on chip?
Smaller circuit delay? Faster?

17/09/2001

Copyright Teemu Kerola 2001

9

Karnaugh Maps

- Represent Boolean function (I.e., circuit) truth table in another way

Fig A.7

- each square is **one product** in sums-of-products (SOP) presentation

- value is one (1) iff corresponding input values give value 1, o/w value is “empty”

- value is 1 if function value for those input values is one

	00	01	11	10
CD	00		1	
01				
11	1			
10		1		

$F = \overline{ABCD} + \overline{ABCD} + ABCD$

17/09/2001

Copyright Teemu Kerola 2001

12

Karnaugh Map Simplification

- Starting point:

– Adjacent squares differ only in one input variable value

Adjacent squares have value 1

Input values differ only in one variable

Value of that variable is irrelevant
(when all other input variables are fixed
to corresponding values for those squares)

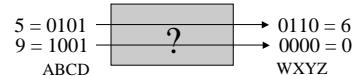

Can ignore that variable for those expressions

17/09/2001

Copyright Teemu Kerola 2001

13

Example: Circuit to add 1 (mod 10) to 4-bit BCD decimal number (4)

Truth table?

Table A.4

Karnaugh maps for W, X, Y and Z?

Fig. A.10

16

Using Karnaugh Maps to Minimize Boolean Functions (6)

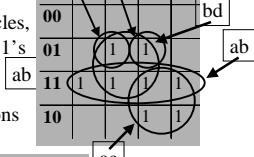

Original function

$$f = \overline{abcd} + \overline{ab\bar{c}\bar{d}} + \overline{abc\bar{d}} + \overline{ab\bar{c}d} + ab\bar{cd} + abc\bar{d} + \overline{ab\bar{c}\bar{d}} + \overline{ab\bar{c}d}$$

Canonical form (now already there)

Karnaugh Map

Find smallest number of circles,
each with largest number of 1's,

Select parameter combinations
corresponding to the circles

Get reduced function $f = bd + ac + ab$

17/09/2001

Copyright Teemu Kerola 2001

14

Quine-McCluskey Method

- Another method to minimise Boolean expressions
- Why?
 - Karnaugh maps become complex with 6 input variables
- Quine-McCluskey method
 - tabular method
 - automatically suitable for programming
 - details skipped

17/09/2001

Copyright Teemu Kerola 2001

17

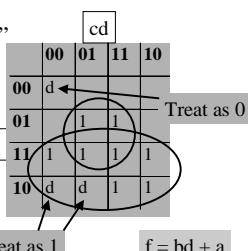

Impossible Input Variable Combinations

- What if some input combinations can never occur?

– Mark them "don't care"
or "d"

– treat them as 0 or 1,
whichever is best

– more room to
optimize

17/09/2001

Copyright Teemu Kerola 2001

15

Basic Combinational Circuits

- Building blocks for more complex circuits
 - Multiplexer
 - Encoders/decoder
 - Read-Only-Memory
 - Adder

17/09/2001

Copyright Teemu Kerola 2001

18

Multiplexers (2)

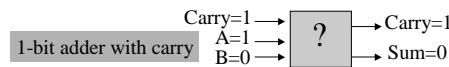

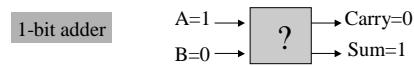

- Select one of many possible inputs to output
 - black box Fig A.12
 - simple truth table Tbl A.7
 - implementation Fig A.13
- Each input/output “line” can be many parallel lines
 - select one of three 16 bit values Fig A.14
 - $C_{0..15}$, $IR_{0..15}$, $ALU_{0..15}$
 - simple extension to one line selection
 - lots of wires, plenty of gates ...

17/09/2001

Copyright Teemu Kerola 2001

19

Adders (4)

Implementation Table A.9, Fig A.22

Build 4-bit adder from 4 1-bit adders Fig A.21

17/09/2001

Copyright Teemu Kerola 2001

22

Encoders/Decoders

- Only one of many Encoder input or Decoder output lines can be 1
- Encode the line number as output
 - hopefully less pins (wires) needed this way
 - optimise for space, not time
 - Example:
 - encode 8 input wires with 3 output pins
 - route 3 wires around the board
 - decode 3 wires back to 8 wires at targetFig A.15

17/09/2001

Copyright Teemu Kerola 2001

20

Read-Only-Memory (ROM) (4)

- Given input values, get output value
 - Like multiplexer, but with fixed data
- Consider input as address, output as contents of memory location
- Truth tables for a ROM Table A.8
 - 64 bit ROM
 - 16 words, each 4 bits wide
- Implementation with decoder & or gates

Mem (7) = 4

Mem (11) = 14

17/09/2001

Copyright Teemu Kerola 2001

21

Sequential Circuit

(sarjalliset piirit)

- Circuit has (modifiable) internal state
- Output of circuit depends (also) on internal state
 - not only from current inputs
 - $output = f(input, state)$
 - $new\ state = f(input, state)$
- Processor control, registers, memory

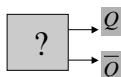

17/09/2001

Copyright Teemu Kerola 2001

24

Flip-Flop (kiikku)

- 2 states for Q (0 or 1, true or false)
- 2 outputs Q and \bar{Q}
 - complement values
 - both always available on different pins
- Need to be able to change the state (Q)

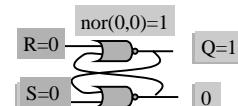

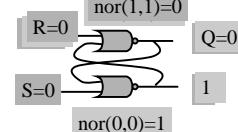

17/09/2001

Copyright Teemu Kerola 2001

25

S-R Latch Set (1) and Reset (0) (n)

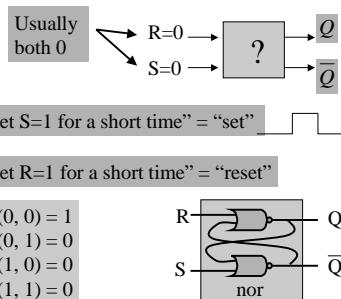

Write 1: $S=0 \rightarrow 1 \rightarrow 0$ Write 0: $R=0 \rightarrow 1 \rightarrow 0$ 

17/09/2001

Copyright Teemu Kerola 2001

28

S-R Flip-Flop or S-R Latch (laituri)

17/09/2001

Copyright Teemu Kerola 2001

26

Clocked Flip-Flops

- State change can happen only when clock is 1
 - more control on state changes
- Clocked S-R Flip-Flop Fig. A.26
- D Flip-Flop Fig. A.27
 - only one input D
 - D = 1 and CLOCK → write 1
 - D = 0 and CLOCK → write 0
- J-K Flip-Flop Fig. A.28
 - Toggle Q when J=K=1 Fig. A.29

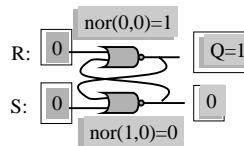

17/09/2001

Copyright Teemu Kerola 2001

29

S-R Latch Stable States (3)

- 1 bit memory (value = value of Q)
- bi-stable, when R=S=0
 - Q=0?
 - Q=1?

nor (0, 0) = 1
nor (0, 1) = 0
nor (1, 0) = 0
nor (1, 1) = 0

17/09/2001

Copyright Teemu Kerola 2001

27

Registers (2)

- Parallel registers
 - read/write
 - CPU user registers
 - additional internal registers
- Shift Registers
 - shifts data 1 bit to the right
 - serial to parallel?
 - ALU operation?
 - rotate?

Fig. A.30

Fig. A.31

17/09/2001

Copyright Teemu Kerola 2001

30

Counters (4)

- Add 1 to stored counter value
- Counter
 - parallel register plus increment circuits
- Ripple counter
 - asynchronous
 - increment least significant bit, and handle “carry” bit as far as needed
- Synchronous counter
 - modify all counter flip-flops simultaneously
 - faster, more complex, more expensive

17/09/2001

Copyright Teemu Kerola 2001

31

Summary

- Boolean Algebra → Gates → Circuits
 - can implement all with NANDs or NORs
 - simplify circuits: Karnaugh, Quine-McCluskey
- Components for CPU design
 - ROM, adder
 - multiplexer, encoder/decoder
 - flip-flop, register, shift register, counter

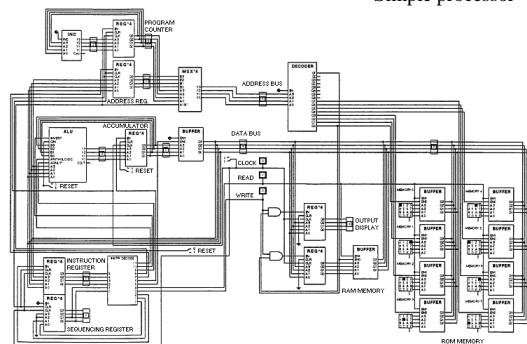

17/09/2001
