Lecture 4

Memory Management (Muistinhallinta)

Stallings: Ch 8.3-8.6
 Memory management
 Swapping vs. virtual memory
 Hardware and software support
 Example: Pentium

Teemu's Cheesecake

Register, on-chip cache, memory, disk, and tape speeds relative to times locating cheese for the cheese cake you are baking...

| Location | Time | Device |
|------------------|---------|------------|
| hand | 0.5 sec | (register) |
| table | 1 sec | (cache) |
| refridgerator | 10 sec | (memory) |
| moon | 12 days | (disk) |
| Europa (Jupiter) | 4 years | (tape) |

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 2

Virtual Memory (virtuaalimuisti)

- Problem: How can I make my (main) memory as big as my disk drive?
- Answer: Virtual memory
 - keep only most probably referenced data in memory, and rest of it in disk
 - disk is much bigger and slower than memory
 - address in machine instruction may be different than memory address
 - need to have efficient address mapping
 - most of references are for data in memory
 - joint solution with HW & SW

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 3

Other Problems Often Solved with VM

- If you want to have many processes in memory at the same time, how do you keep track of memory usage?
- How do you prevent one process from touching another process' memory areas?
- What if a process needs more memory than available?

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 4

Memory Management Problem

- How much memory for each process?
 - Is it fixed amount during the process run time or can it vary during the run time?
- Where should that memory be?
 - In a continuous or discontinuous area?
 - Is the location the same during the run time or can it vary dynamically during the run time?
- How is that memory managed?
- How is that memory referenced?

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 5

Partitioning

- How much physical memory for each process?
- Static (fixed) partitioning (*kiinteät partitiot, kiinteä ositus*)
 - Amount of physical memory determined at process creation time
 - Continuous memory allocation for partition
- Dynamic partitioning (*dynaamiset partitiot*)
 - Amount of physical memory given to a process varies in time
 - Due to process requirements (of this process)
 - Due to system (I.e., other processes) requirements

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 6

Static Partitioning

- Equal size - give everybody the same amount
 - Fixed size - big enough for everybody
 - too much for most
 - Need more? Can not run!
- Unequal size
 - sizes predetermined
 - Can not combine
- Variable size
 - Size determined at process creation time

Fig. 8.14 [Sta06]

Computer Organization II, Spring 2010, Tiina Niklander

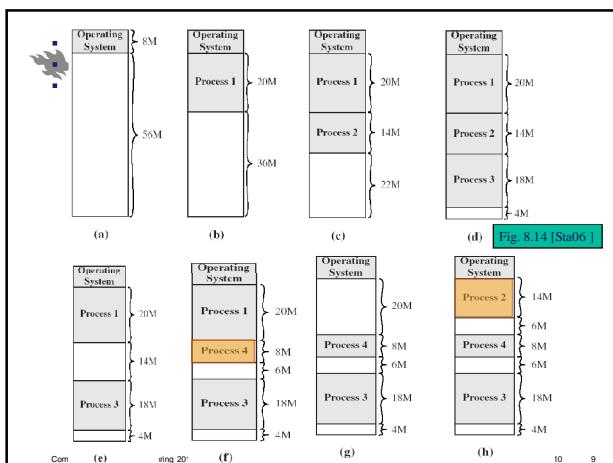

28.1.2010 7

Dynamic Partitioning

- Process must be able to run with varying amounts of main memory
 - all of memory space is not in physical memory
 - need some minimum amount of memory
- New process?
 - If necessary reduce amount of memory for some (lower priority) processes
- Not enough memory for some process?
 - reduce amount of memory for some (lower priority) processes
 - kick (swap) out some (lower priority) process

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 8

Fragmentation (pirstoutuminen)

- Internal fragmentation (sisäinen pirstoutuminen)
 - unused memory inside allocated block
 - e.g., equal size fixed memory partitions
- External fragmentation (ulkoinen pirstoutuminen)
 - enough free memory, but it is splintered as many unallocatable blocks
 - e.g., unequal size partitions or dynamic fixed size (variable size) memory partitions

Fig. 8.13 (a) [Sta06]

Fig. 8.13 (b) [Sta06]

Fig. 8.14 [Sta06]

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 10

Address Mapping (osoitteiden muunnos)

Pascal, Java:

```
while (...) X := Y+Z;
```

Symbolic Assembler:

```
loop: LOAD R1, Y
      ADD R1, Z
      STORE R1, X
```

Textual machine language:

```
1312: LOAD R1, 2510
      ADD R1, 2514
      STORE R1, 2600
```

(addresses relative to 0)

Execution time:

```
101312: LOAD R1,102510
      ADD R1,102514
      ADD R1,102600
```

(real, actual!)

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 11

Address Mapping

logical address

Textual machine language:

```
1312: LOAD R1, 2510
```

+100000?

Execution time:

```
101312: LOAD R1,102510
      or
      101312: LOAD R1, 2510
```

physical address (constant?) logical addr ??

- Want: $R1 \leftarrow \text{Mem}[102510]$ or $\text{Mem}[2510]$?

- Who makes the mapping? When?

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 12

Address Mapping, address translation

- At program load time
 - Loader (*lataaja*)
 - Static address binding (*staattinen osoitteiden sidonta*)
- At program execution time
 - CPU
 - With every instruction
 - Dynamic address binding (*dynaaminen osoitteiden sidonta*)
 - Swapping (*heittovaihto*)
 - Virtual memory

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 13

Swapping (*heittovaihto*)

- Process has continuous memory area
 - Process fully in memory or on disk
 - Process control block, PCB (*prosessikuvaaja*) always in memory
- Address translation at execution time (*ajonaikainen*)
 - Logical address → physical memory address
- Memory management unit, MMU, - **hardware** support
 - Base and limit registers (*Kanta- ja rajarekisterit*)
 - "Bounds exceeded"-interrupt
- Operating System (OS) (*käyttöjärjestelmä*)
 - Bookkeeping about unallocated (free) memory areas
 - Process swapping between memory and disk
 - Process switch: set new values to base and limit registers
 - Illegal (unauthorized) memory access: kill the process

More on OS course

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 14

Virtual Memory Implementation (*Virtuaalimuistitoteutus*)

- Methods
 - Base and limit registers (*kanta- ja rajarekisterit*)
 - Segmentation (*segmentointi*)
 - Paging (*sivutus*)
 - Segmented paging, multilevel paging
- Hardware support
 - MMU - Memory Management Unit
 - Part of processor
 - Varies with different methods
 - Sets limits on what types of virtual memory (methods) can be implemented using this HW

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 15

Base and Limit Registers

- Continuous memory partitions
 - One or more (4?) per process
 - May have separate base and limit registers
 - Code, data, shared data, etc
 - By default, or given explicitly in each mem. ref.
- BASE and LIMIT registers in MMU
 - All addresses logical in machine instructions
 - Exec. time address mapping for address (x):
 - Check: $0 \leq x < \text{LIMIT}$
 - Physical address: $\text{BASE} + x$

From Comp. Org I

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 16

Virtual memory

OS course content

- Only needed chunks in the memory, no need to be contiguous
 - Demand paging (*Tarvenouto*)
- Chunk size?
 - Fixed size = Paging
 - Variable size = Segmentation
 - Combined = Paged segments
- OS bookkeeping (*KJ:n kirjanpito*)
 - Page frame table (*sivutilataulu*)
 - Which page frames are free, which are occupied
 - Each process has its own page table (*sivutaulu*)
 - Page in memory or on disk? Presence-bit
 - In memory, which page frame contains this page?
 - Other control? Bits: Modified, Referenced

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 17

Virtual Memory: Paging (*sivutus*)

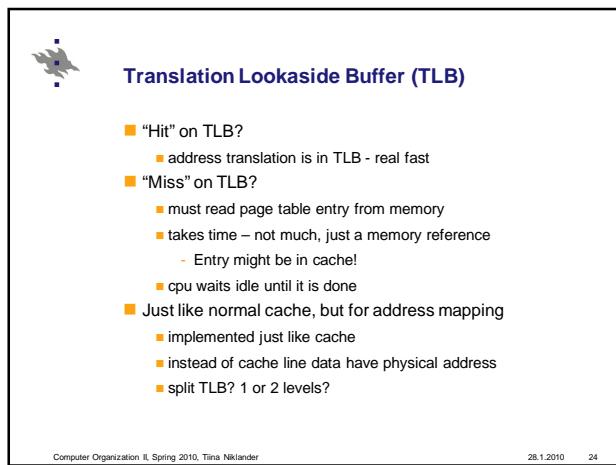

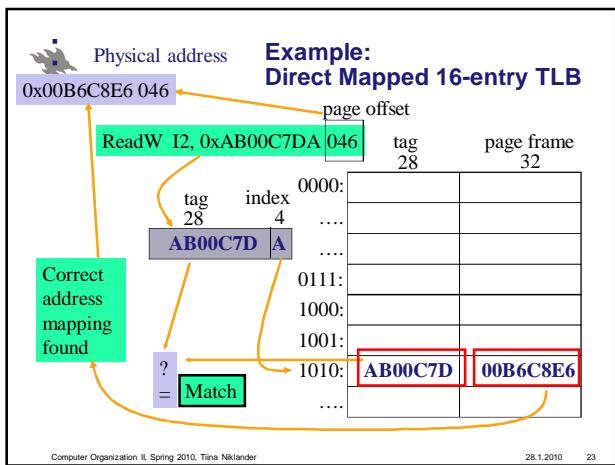

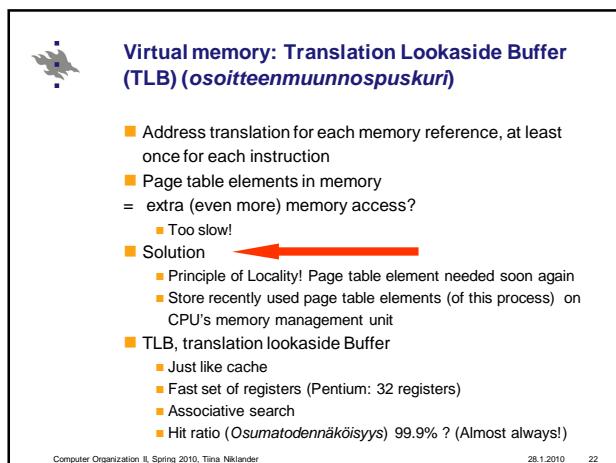

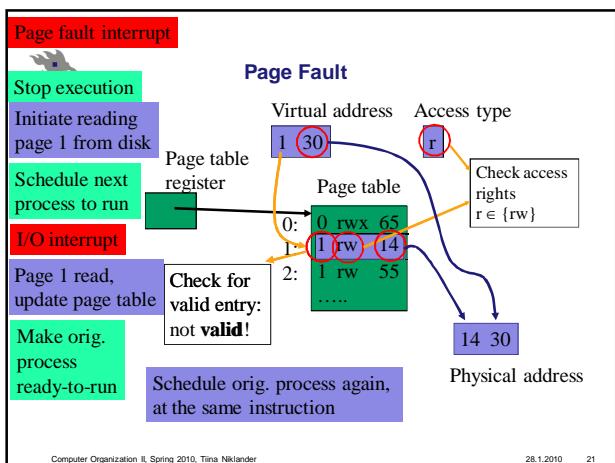

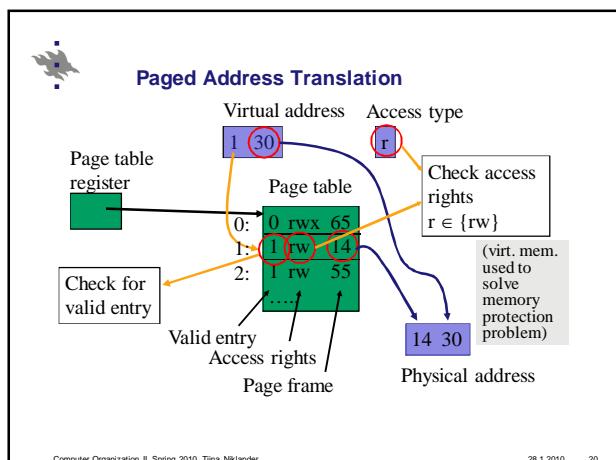

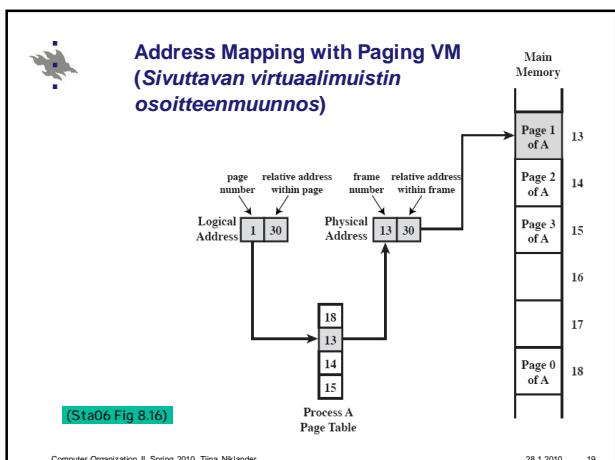

Program: pages
Memory: frames

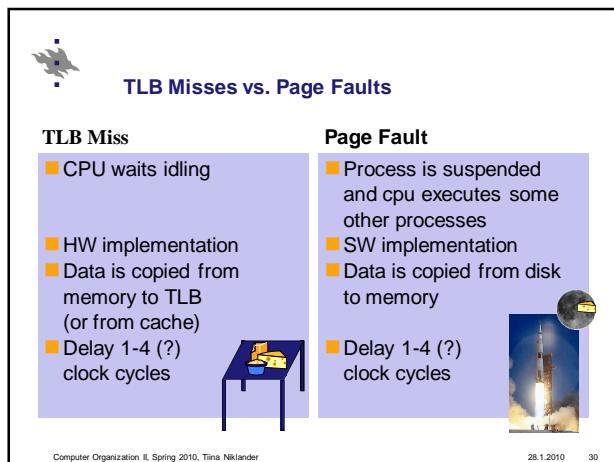

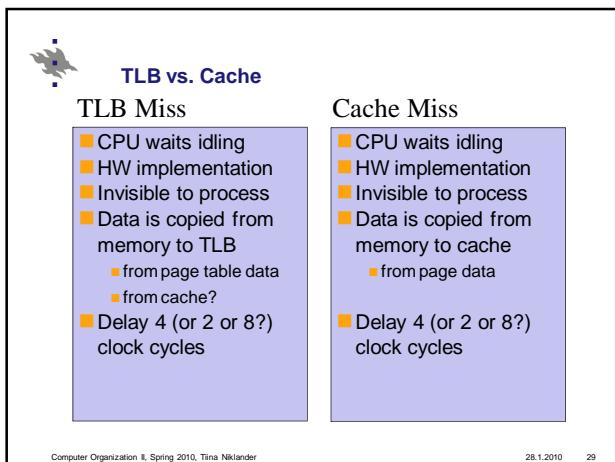

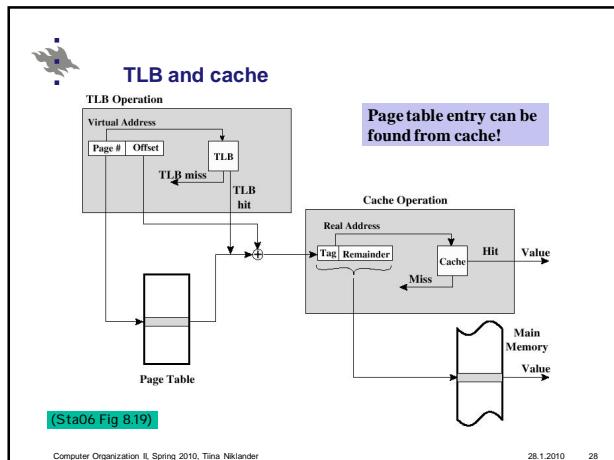

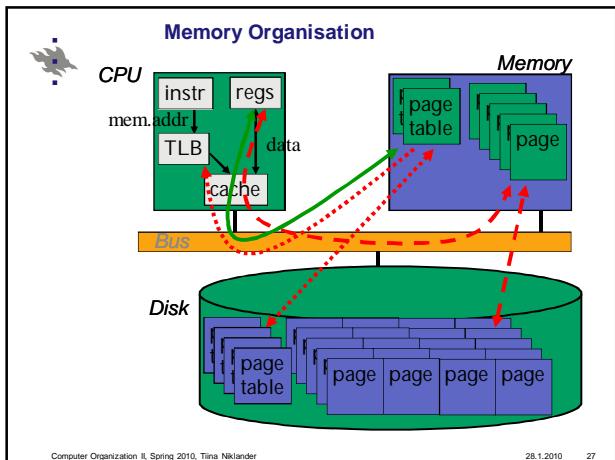

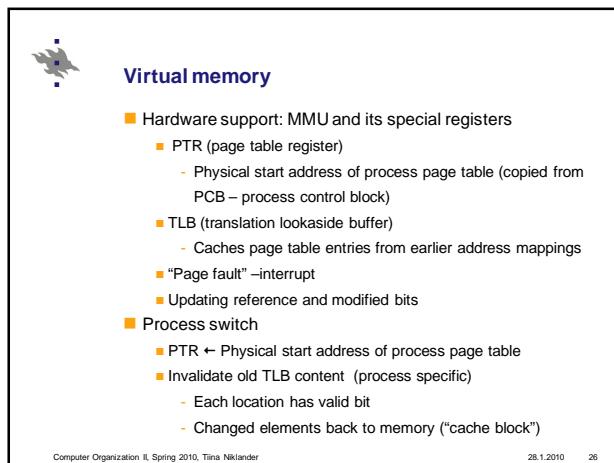

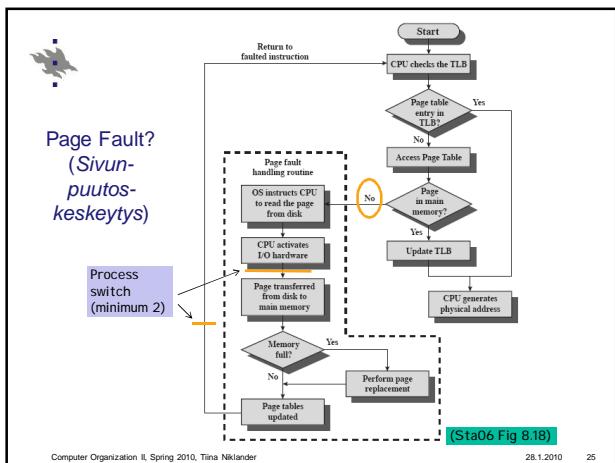

Process A in main memory

(Sta06 Fig 8.15)

Computer Organization II, Spring 2010, Tiina Niklander

28.1.2010 18

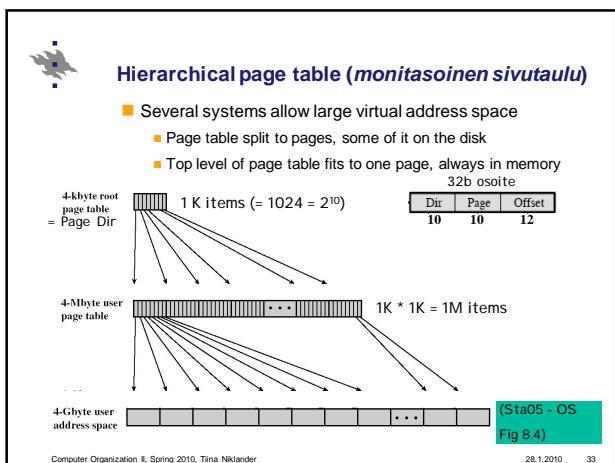

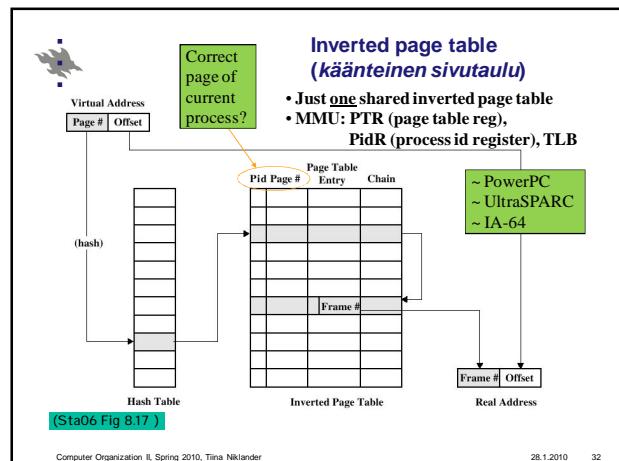

Replacement policy (*Korvauspolitiikka*)

- Which page should be replaced, when there is not enough free page frames in main memory?
- Local/global policy
 - Select from the process's own pages
 - Select from all pages (of all processes)
- Algorithm
 - Clock, Second chance, LRU, ...
- MMU
 - At page access set Referenced=1 (read)
 - set Modified=1, page content changed (write)
- OS
 - Reset Referenced and Modified "periodically"
 - Replace a page where R=0, M=0
 - M=1 \Rightarrow write the page to disk before reusing the page frame

OS course

Computer Organization II, Spring 2010, Tiina Niklander 28.1.2010 31

- ### Virtual Memory Policies
- Fetch policy (*noutopolitiikka*)
 - demand paging: fetch page only when needed 1st time
 - working set: keep all needed pages in memory
 - prefetch: guess and start fetch early
 - Placement policy (*sijoituspolitiikka*)
 - any frame for paged VM
 - Replacement policy (*poistopolitiikka*)
 - local, consider pages just for this process for replacement
 - global, consider also pages for all other processes
 - dirty pages must be written to disk (*likaiset, muutetut sivut*)
- Computer Organization II, Spring 2010, Tiina Niklander 28.1.2010 34

Computer Organization II

Example

Pentium (IA-32)

See also Tan06

Computer Organization II, Spring 2010, Tiina Niklander 28.1.2010 35

- ### Pentium support for memory management
- Unsegmented unpaged, max $2^{32} = 4$ GB
 - Virtual address = physical address
 - Efficient \Leftrightarrow feasible in real-time systems
 - Unsegmented paged (*Sivuttava*), max 4 GB
 - Linear address space (*lineaarinen osoiteavaruus*)
 - Page and frame size: 4KB or 4MB
 - Protection frame based
 - Segmented unpaged (*Segmentoiva*), max $2^{48} = 64$ TB
 - Several segments \Leftrightarrow several linear memory spaces
 - Protection segment based
 - Segmented paged (*Sivuttava segmentointi*), max 64 TB
 - Memory management using pages and page frames
 - Protection segment based
- Computer Organization II, Spring 2010, Tiina Niklander 28.1.2010 36
